

# DEFINE CGI

---

The DEFINE CGI command adds a CGI phase or REXX program to *TCP/IP for VSE*. Once added, the CGI can be invoked with a web-browser request.

---

Syntax: `DEFine CGI PUBlic=member ,TYPE={CGI|CGI-BAL|CGI-REXX}`

---

Arguments: PUBLIC - The name of the program to be invoked.

---

TYPE= -

CGI - An "old-style" CGI routine

CGI-BAL - An assembler routine using the current interface definition.

CGI-REXX - A CGI routine coded in REXX.

---

Example:

```
IPN237I define cgi,public='addrbk',type=cgi-rexx
IPN694I Entry defined
```

- Notes:
- See the *TCP/IP for VSE Programmer's Reference* for more information about writing CGI programs.
  - The response in the above example refers to a file being defined. This is normal.
- 

Related Commands: DELETE CGI - Remove a CGI program from storage.  
QUERY CGIS - Displays all currently available CGI programs
