

DELETE ALTIP

The DELETE ALTIP command deletes IP addresses that were previously identified using the DEFINE ALTIP command.

Syntax: `DELeTe ALTIP ID=id`

Arguments: ID= - The ID= parameter that was specified in the DEFINE ALTIP command that created the entry.

Example:

```
IPN237I delete altip,id=sys2
IPN581I ALTIP SYS2 has been deleted.
```

Notes:

- Note that deleting an ALTIP entry does not immediately cancel its effects. This is because most hosts on your network issue an ARP request and then retain the results for a period of time. These values eventually expire (or the host reboots) and a new ARP request is issued.

Related Commands:	DEFINE ALTIP	- Causes the stack to monitor and respond to ARP requests for additional home addresses.
	DEFINE LINK	- Create a link between TCP/IP and a network or to a directly-connected stack.
	DEFINE ROUTE	- Add an entry to the TCP/IP routing table.
	QUERY ALTIPS	- Displays all alternate IP addresses.
