

FTPbatch_fetch

TCP/IP for VSE provides two batch FTP clients. One, invoked via EXEC FTPbatch, provides its own internal FTP Daemon and uses the TCP/IP partition only for data transmission. The other client, EXEC FTP, is only a client and relies on an FTP Daemon running in the TCP/IP partition.

This command allows you to force invocation of FTPbatch, regardless of the program executed.

Syntax: FTPbatch_fetch {ON|OFF}

Arguments: ON - When the batch program, "FTP" is executed, the FTPbatch program will be fetched and executed instead.

OFF - Batch execution of "FTP" will run the batch FTP client.

Example:

```
IPN237I ftpbatch_fetch on
IPN249I Value for FTPbatch Fetch set to on
```

- Notes:
- The batch FTP client, "FTP", reads control cards and passes commands to the *TCP/IP for VSE* internal FTP client. This means that all disk/tape I/O and FTP processing will occur in the stack partition.
 - FTPbatch is self-contained and executes in a batch partition. It uses the stack partition only to process socket requests.
