

SET LINK_RETRY

The SET LINK_RETRY command specifies the default length of time that must elapse before *TCP/IP* for *VSE* attempts to reinitialize a link driver that fails to initialize.

Syntax: SETLINK_retry=*time*

Arguments: *time* - Numeric, 0 through 9999999, in 300th seconds

The interval to be used between attempts to initialize a link driver. The default value is 18000 (60 seconds).

Example:

```
IPN237I set link_retry=1800
IPN268I LINK_RETRY now set to 1800
```

Notes:

- You can also specify a value of LINK_RETRY= on the DEFINE LINK command. That value overrides the global default defined by SET LINK_RETRY.
